

# Good Clinical Practice Compliance and the Start-up Company

By Robert Schiff, PhD, RAC, CQA, FRAPS, Jodi Pannucci and Mary Ann Weinberg

Start-up drug or device companies tend to minimize spending and occasionally to be "penny wise and pound foolish." However, when conducting clinical studies, rules must be followed to ensure the reliability of data. There are many pitfalls a start-up can fall into when first conducting clinical studies. These can be minimized or eliminated by planning the various items for a clinical study before execution and employing skilled and experienced individuals to monitor and audit the studies.

A start-up faces the need to demonstrate some efficacy to the US Food and Drug Administration (FDA) early in the product lifecycle. This efficacy demonstration, which is done before any clinical studies begin, is usually called "proof of concept" in animals. For a drug, the normal next step is to conduct clinical testing in humans to demonstrate safety and some efficacy if possible. Moving into Phase 1 testing on patients, the company is required to demonstrate safety. Efficacy is not considered. However if the drug has a high toxicity profile or is used in stage 4 cancers, for example, a Phase 1b study or use in subjects who are in the latter stages of the disease is permitted by FDA. Devices, on the other hand, can undergo pilot studies to determine efficacy. If safety is not an issue and an Investigational Device Exemption (IDE) is not necessary—only institutional review board (IRB) approval is required—the proof of concept can be determined quickly.

When multiple clinical sites are used, all sites must follow the same protocol and be compliant with the regulations. The regulations covering Good Clinical Practice (GCP) are limited. They can be found in 21 CFR Parts 50,<sup>1</sup> 56,<sup>2</sup> 312<sup>3</sup> and 812.<sup>4</sup> GCP is governed primarily by guidances, the most prominent and useful of which is ICH Good Clinical Practice E6.<sup>5</sup>

Following a successful proof of concept, the fledgling company may choose a major clinical research organization (CRO) such as Kendle, Quintiles, etc., to run its clinical studies. Most CROs are very competent managers of clinical studies. However, even CROs can experience GCP problems that may invalidate the clinical study results. Johnson and Johnson (J&J) chose ICON to act as the CRO for clinical studies of a drug that J&J licensed from a European company. A Bioresearch Monitoring Program inspection by FDA revealed ICON's performance was so inadequate that the agency indicated that there was a data integrity issue and both organizations were issued Warning Letters.<sup>6,7</sup> This poor outcome has also resulted in legal proceedings against Johnson and Johnson.8

The second choice is a smaller CRO with fewer resources but the capability to do the task. The fees for a smaller CRO to manage a clinical study tend to be 50% or less than those of a larger company. However, all CROs have a relatively high study monitor turnover rate. Although this figure is not reported, our

experience has been that monitors leave their current positions every few years.

The next choice is to encourage a clinical investigator to file an investigator Investigative New Drug Application (IND) and act as the sponsor of the clinical study. Commonly, the manufacturer of the drug or device believes an investigator-sponsored clinical study will somehow move faster and not require as much compliance. This is not true; the same GCP compliance requirements apply whether the sponsor is an investigator or the manufacturer.

We as auditors find two primary deviations from GCP in investigator-sponsored studies. The first is failure to follow the protocol and the second is failure to monitor the study. These deviations may result from lack of knowledge about the requirements and practice of GCP.

In addition, both investigator- and manufacturer-sponsored studies may demonstrate a lack of adherence by the investigator to the commitments found on Form 15729 (see Figure 1) for drug studies. In particular, in Section 9, the investigator agrees "to personally conduct or supervise the described investigation(s)." Sponsors like to pick "thought leaders" for their clinical studies. Therefore, a well-known investigator may be the principal investigator (PI) for several studies as well as conduct a private practice. However, under Section 9, the investigator cannot delegate all responsibilities to a subinvestigator. If the investigator delegates study supervision, the study is not being conducted under GCP. This presents a very difficult site qualification task to the monitors or auditors who determine that a clinical site can be part of a study as part of the formal selection of investigators.

In our practice, we usually present the potential investigator with a copy of 21 CFR 312 and Form 1572 prior to the qualifying visit. At the visit, we discuss with the investigator in private whether the commitments can be met. Rarely do we get a negative response. However, we do suggest, when appropriate, that a subinvestigator act as the principal and the thought leader serve as a subinvestigator. If the thought leader wishes to remain as the PI, we caution the monitors to be extra diligent and professional in determining the PI's participation in the study.

Given the above, the last choice for the new company is to manage the clinical study by itself. Described below are some of the deficiencies and substandard practices that can lead to poor clinical results and lack of compliance. Although these may occur in studies managed by both large and small CROs, it has been our experience that they are more frequent with start-up companies.

#### **Omitting an Investigator's Meeting**

Bringing investigators together for one or two days at a central location is expensive. Usually the investigators are accompanied by their clinical coordinators, thus adding more cost. To save money, the company may opt to have a teleconference, visit the site for instruction or explain by phone. These methods tend to minimize the interaction among investigators and coordinators and limit the understanding of the protocol by all involved. This may result in failure to follow the protocol and/or fill out the case report (record) form (CRF) properly.

#### **Insufficient Monitoring Visits**

The Code of Federal Regulations and GCP guidance do not specify the number of monitoring visits. It is left to the sponsor to determine how many visits are sufficient to establish that the protocol is being followed, the subjects are properly consented and are treated safely, all sites are performing in the same manner with respect to the protocol and GCP, etc. At this stage of corporate development, there may be less funding available than when the start-up was formed, thus restricting the ability to conduct monitoring visits. This presents another concern. If FDA audits the company records for the clinical study or goes to the clinical sites and finds a number of deviations or violations that should have been observed and corrected by frequent monitoring visits, a Form 483 may be issued. It has been our practice with agreement from the sponsor that if the monitoring visits are too infrequent, to note this in the clinical report. To date we have not had a sponsor object to this inclusion.

#### **Inadequate Case Record Form**

Prior to commencing the clinical study and before an IND or IDE is submitted to the agency, the protocol is submitted to the investigators for review, comment and budget estimation. After obtaining agreement, a CRF is prepared. If it is not sent to the investigators for comment, information that can be critical to the interpretation of results may be omitted. In this respect, the inclusion and exclusion criteria need to be very specific. For example, if laboratory results need to be reviewed prior to randomization or formal entrance into a study, how does one treat values such as elevated cholesterol? One can either let the investigator decide that the result is "not clinically significant" (NCE) or define a limiting value in the protocol and subsequently in the CRF.

#### **Stinting on Laboratory Analysis**

In both drug and device studies, it may be imperative to establish the subject's physical condition. When performing *in vitro* diagnostic assays, if the results of the investigational assay are compared to a cleared (510(k)) or approved device (PMA) there will probably be discrepancies. It is very helpful to gather as much information as is reasonable about the subject to explain the indeterminate or discrepant result.

In some device studies, the sponsor may wish to avoid performing lab tests on subjects to save money. We attempt to persuade the sponsor of the necessity to obtain laboratory results with appropriate examples

#### Failing to Keep Screening and Subject Numbers Straight

This may seem trivial but it is not. When subjects are first evaluated or screened for participation in a clinical study, they are assigned a screening number. After the subject is randomized or enters the study, he or she will get a new subject number. There is a tendency in some studies that we have witnessed for these numbers to be mixed up. This needs to be corrected quickly.

## Subjects Not Following Predetermined Schedule of Visits

A new company with its own monitors may not understand how to keep subjects on schedule. Results can be dramatically confounded by alteration of visits. Schedule adherence must be a function of the investigator and his staff. Prior to study commencement, the sponsor must discuss with the investigator how to handle subjects on weekends and holidays and the missed timetable limits that can be tolerated. Experienced monitors will prepare a chart listing each subject upon enrollment in the study and when a specific activity is to occur. The chart will include the acceptable time limits or window for the treatment or activity.

#### **Inconsistent Monitor Training**

Assuming there is more than one monitor, each should perform in very similar ways. To obtain the same information, at the very least, each monitor must use the same checklist. Start-up companies may have individual staff that have had this experience and can develop or write checklists. Monitors must also follow up with the investigator if there is a need for corrective action after a monitoring visit has detected deviations and violations of the protocol. This can be done by phone and fax and checked during the next monitoring visit. The need for rapid follow up should be addressed uniformly during initial monitor training for the study. Monitors must always be trained on the specifics of the protocol and CRF.

## Source Documents Not Matching CRFs

The start-up company needs to be aware that individual investigators may maintain their source documents differently. The ideal situation is to have extensive subject records. Some clinical sites will make copies of the CRF and use it as the source for subject information. This is less

Enhance your performance, expand your regulatory knowledge and build a strong community of peers at a time and place convenient for you.

#### 2010 RAPS Education Calendar

## Engage in regulatory education delivered conveniently to you!

Explore RAPS' virtual educational opportunities and learn from the convenience of your home or office—without incurring travel costs!

- Attend a Webcast—cost is per site and includes unlimited participants at the site.
- Complete one of the many new RAPS Online University courses—Pharmaceuticals, Medical Devices and Dual Certificates are available.

RAPS' face-to-face meetings and convenient virtual learning events provide regulatory professionals at all levels with world-class programming led by experts in industry, government and academia so you can stay current on the latest regulatory knowledge.

#### **UPCOMING MEETINGS**

RAPS Executive Development Program—Kellogg School of Management 14–17 June 2010 Evanston, IL

Managing Risk: Tackling REMS and RMPs 17–18 June 2010 Rockville, MD

2010 RAPS Annual Conference & Exhibition 24–27 October 2010 San Jose, CA

#### DEPARTMENT OF HEALTH AND HUMAN SERVICES FOOD AND DRUG ADMINISTRATION STATEMENT OF INVESTIGATOR

Form Approved: OMB No. 0910-0014. Expiration Date: May 31, 2009. See OMB Statement on Reverse.

NOTE: No investigator may participate in an investigation until he/she provides the sponsor with

than ideal and FDA does not prefer this method. There needs to be an independent method of verifying the information on the CRF. With the introduction of electronic data transfer, the monitor and auditor need to have a method of verifying source information against the entered data. This can be done on site or the monitor can compare a printout to the source data.

Listed below are additional areas that need correction.

- failure to follow the clinical protocol
- clinical coordinators lacking proper training or experience

- changing monitors or coordinators in the middle of the study
- PI who is not familiar with the protocol
- lack of PI supervision as indicated by late signing of or failure to sign CRFs
- PI signoff on items not reviewed
- subjects with improperly completed consents, e.g., missing dates and signatures
- consents signed after administration of drug or device
- drug or device storage not controlled or adequate

- IRB approvals not available

#### Conclusion

A start-up company may rush into clinical studies but underestimate study costs and timing.

The company needs to plan a strategy that defines budgets for preclinical and first-in-man clinical studies. Timetables for the studies must be rational and realistic. Competent individuals, either within the company or outside consultants, should help develop the strategy and execute it. Clinical study management should be very carefully coordinated between the sponsor and any external CRO. When selecting the CRO, competency and experience are the most important requirements. Clinical investigators also should be selected based upon their experience and, especially, their knowledge of regulatory requirements. Following these simple

PAGE 2 OF 2

suggestions can help reduce the frustrations and errors that can occur in clinical work.
